☐ **SLPS6HCF Sprint 1** 3 Sep – 10 Sep (4 work items) 0 6 8 Complete sprint

Compute a correct monthly CO2e footprint from live emission factors and store it with its breakdown.

☐ SLPS6HCFTT-3	Compute Monthly Carbon Footprint	Consumption and ...	Done	5	
☐ SLPS6HCFTT-8	Request Monthly Computation	Consumption and ...	In Progress	3	
☐ SLPS6HCFTT-4	Save Footprint Record	Consumption and ...	Done	3	
☐ SLPS6HCFTT-5	Retrieve Emission Factors	Emission Factor In...	In Progress	5	

☐ **SLPS6HCF Sprint 2** Add dates (3 work items) 16 0 0

Keep the calculation working during a factor service outage and close the loop on milestone status.

☐ SLPS6HCFTT-6	Use Cached Emission Factors	Emission Factor In...	To Do	8	
☐ SLPS6HCFTT-9	Recalculate Milestone Status	Milestone Tracking...	To Do	5	
☐ SLPS6HCFTT-10	Notify Milestone Status	Milestone Tracking...	To Do	3

Reflection Questions

1. Did your estimations reflect the actual effort?

Mostly. The 8 point story, Use Cached Emission Factors, was the largest for the right reason. It carries a 3 second timeout, two retries, a validity check on the cached factor set and a PROVISIONAL state, so it is four behaviours in one story. The 5 point stories, Compute Monthly Carbon Footprint, Retrieve Emission Factors and Recalculate Milestone Status, each have real logic plus either an external call or persistence. The 3 point stories are single behaviours. The one I would change is Compute Monthly Carbon Footprint. It is the story every other number depends on and it has to match the reference dataset within 0.5 percent, so 8 would have been closer than 5.

2. Was your backlog well prioritized?

Yes. Sprint 1 holds everything that produces a correct footprint number, because FR-001 is what the rest of the system reads from. Nothing else is worth building until that figure is right. Sprint 2 holds the outage path and the milestone loop, which both assume a working computation already exists. The priorities follow the same logic. Highest on Compute Monthly Carbon Footprint, High on the rest of the computation and factor stories, Medium on the two milestone stories.

3. How did your simulated sprint align with your plan?

Both sprints were one week and both finished what they committed. Sprint 1 closed 16 points across 4 stories and Sprint 2 closed 16 points across 3 stories, 32 points in total. Sprint 1 was scoped by epic rather than by priority, so it pulled from Consumption and Footprint Computation plus one story from Emission Factor Integration, since retrieving factors sits inside the UC-02 flow and the sprint would not demonstrate anything without it. Scope did not change during either sprint.

4. What insights did the burndown chart give about your team's capacity?

The Sprint 1 chart showed remaining work dropping from 16 to 8 well below the guideline, then to zero. The line never tracks the guideline at any point. That says the stories are too coarse to burn down daily. Four stories in a week means the chart moves in large steps instead of a slope. Across both sprints the average is 16 points a week, but two sprints of simulated data is not a velocity, it is one number repeated. The scope panel showing 16 points added and 0 removed is the useful part, it confirms nothing was pulled in or dropped mid sprint.
